

Team 2 has decided on going with option 1, we will not be using a full DevOps toolchain platform, but instead several other tech solutions that we are all already familiar with. The reason we have chosen this is so that we can spend less time learning new technologies, and also we have already set up a workflow that we have all agreed on. To start off for communication and homework we are utilizing a combination of zoom, and discord as all of us are well familiar with both of these platforms from socializing or school purposes. Discord allows file uploads up to a certain time, and communication is made very easy on phones or computers so it is just the natural pick. Holding certain meetings on Zoom allows us to get transcripts and take notes easier.

As for the development of the fitness and health application we will be moving ahead using Github. Github has several features that make collaboration between developers easier and more streamlined. For instance Github covers branches, issues, pull requests, lets us upload more than just code files, and supports projects like ours. We will use it not only for the project, but also have been using it to upload the homework that we collaborate on. The

project may also utilize Amazon Web services but this is not a guarantee.

In conclusion Team 2 will be using the tools that we are all familiar with so that our working as a team will be very efficient, with less roadbumps.
